Mathematical and numerical analysis for a family of parabolic mixed equations: applications to the eddy current model

Dr. Ramiro Acevedo

**Departamento de Matemáticas
Universidad del Cauca - Colombia**

Resumen

The aim of this work is to show an abstract framework to analyze a family of linear degenerate parabolic mixed equations and its fully-discrete approximation by using a backward Euler discrete scheme for the time-derivatives. We combine the theory for the degenerate parabolic equations [6] with the classical Babuska-Brezzy theory to deduce necessary and sufficient conditions to prove the well-posedness for both problems. Next, we show two mixed finite element formulations which arise from electromagnetic applications [1,2] and deduce their well-posedness by using the developed abstract theory. Finally, we give general and sufficient conditions for the convergence of the approximation, which are satisfied by the applications previously mentioned. The main results of this talk can be found in [3]. Other studies on mixed parabolic problems are presented in [4,5].

Trabajo en conjunto con Christian Gómez y Bibiana López-Rodríguez.
